SYNARETE ENGINEERING · WAREHOUSE MANAGEMENT

ServiceNow WMS End-to-End Test Guide

A step-by-step menu to test the ServiceNow Site Work Order process from first import to dashboard and reports. HTT is a separate process and is not covered here.

System	App	Audience
Local Docker bench erp.synarete.co.tz	synarete_wms ServiceNow module	Warehouse / WMS testers and implementation

How to use this guide

Work the tests in order (T0 → T10). Tick each checkbox when the expected result is true. If a step fails, stop and record the work order number, transaction name, and screenshot. Do not mix HTT receipts or HTT issues into these tests.

1. Test menu

Complete these tests in sequence. Each later test depends on the previous one.

ID	Test	You will prove	Pass when
T0	Masters ready	Site, Item, warehouse, MP partners exist	Two MPs only: Synarete and JD Electronics
T1	Import / create SWO	Mandatory SWO fields auto-fill. No manual typing of those fields.	ServiceNow Site Work Order opens with site, status, created on, process status
T2	Open dashboard	Search “servicenow dashboard” opens the live page	KPI cards and two charts show. URL /app/snwo-overview
T3	Receive material	Client / request stock is received against the original SWO	Qty Received increases. Process status = Material Received. Dashboard site count increases
T4	Issue from received	Issue only from warehouse remaining of that SWO	Cannot over-issue. Warehouse Remaining falls. Qty Issued rises
T5	Interchange	Issue received stock to a different SWO, with reason	Original SWO shows Interchanged Out. Target shows Interchanged In. Original request is never deleted
T6	Issue MP stock	Company stock is used and warehouse qty is deducted	Stock Balance of Main Warehouse falls. MP Material Used = Yes. Dashboard site-use MP count increases
T7	Consume	Only issued qty can be consumed on site	Cannot consume more than remaining issued. Qty Remaining falls
T8	Reconcile & complete	Close the material loop and mark the SWO complete	Process status Completed. MP stock already deducted
T9	Reports	Traceability is the full summary; other SNWO reports still work	Traceability row matches the SWO. MP report shows warehouse remaining, not 0, for MP lines
T10	Dashboard & export	Overview cards, graphs, date filter, Excel export	Numbers match the period. Export downloads xlsx. No site-name chip list under MP

Scope rule
ServiceNow and HTT are separate. Do not post HTT Material Receipt or HTT issues as part of this script. Do not change HTT configuration while testing ServiceNow.

2. Process flow (what you are testing)

The original ServiceNow request is never deleted. Every later movement is a new **SNWO Material Transaction** that points back to the original work order.

1. Import SWO Created / Material Required	**2. Receive** Against original SWO	**3. Issue** From received qty	**4. Interchange** To another SWO
5. MP Issue Deduct warehouse stock	**6. Consume** On the receiving SWO	**7. Reconcile** Optional close-out	**8. Complete** Dashboard + reports

Process status moves automatically: Created → Material Required → Material Received → Material Issued → Material Consumed → Reconciliation → Completed.

3. T0 — Masters (do this once)

If these already exist from earlier local setup, tick and skip. Do not create extra Maintenance Partner records.

- Open **Maintenance Partner**. Confirm exactly two records: **Synarete** and **JD Electronics**.
- Open **WMS Site**. Pick one active test site (example: a site whose code you know, such as a Kongowe site). Confirm it has a Maintenance Partner.
- Open **WMS Settings**. Confirm **Company** and **Main Warehouse** are set.
- Open **Item**. Pick one stock item that has quantity in Main Warehouse (needed for MP issue).
- Open **Stock Balance** for that item and Main Warehouse. Write the qty here: _____
- Login as a user with Stock User / Warehouse Manager / System Manager.

Expected: You can search Desk for “ServiceNow Site Work Order”, “SNWO Material Transaction”, and “ServiceNow Dashboard”.

4. T1 — Create or import the ServiceNow Work Order

Mandatory SWO fields must be auto-populated by import/transform. Testers must not type those eight business fields by hand.

Option A — Import (preferred)

- Go to **Data Import** → New → DocType **ServiceNow Site Work Order**.
- Map or paste a ServiceNow row that includes at least: number / swo_number, site / u_site, status, sys_created_on, short_description, order type, part (if Material), quantity.
- Start Import. Open the new document. Confirm SWO Number, Site, Status, Status Group, Created On, Source System = ServiceNow, Process Status, and Days Open are filled without you typing them.
- If order type is Material and a part/qty is present, a materials row is created with Qty Requested, and Process Status is **Material Required**.

Option B — Manual create (only if import is not available)

- New **ServiceNow Site Work Order**. Enter SWO Number (unique), Site, Status, Created On, Order Type.
- Save. Maintenance Partner and Transition Partner fetch from the site. Do not type them.
- If Material: enter Part Code / Quantity. Save again and confirm the materials child row exists.

Write down: SWO A (original) = _____ Site = _____

Expected: Document name equals SWO Number. Process Status is Created or Material Required. MP Material Used is 0.

Fail if: You are forced to type status group, days open, source system, or maintenance partner. Fail if HTT fields appear on this form.

5. T2 — Open ServiceNow Dashboard

- In Desk search, type **servicenow dashboard** and open it.
- Confirm the page title is ServiceNow Dashboard and the heading is Dashboard Overview.
- Confirm the address is **/app/snwo-overview** (the old /app/servicenow-dashboard may redirect here). The page is not empty.
- Set From / To to this month. Click **This Month** if needed.
- Note Total Work Orders. After T1 it should include SWO A if Created On is in the month.

Expected: Seven KPI cards, two charts, date filter, Export Report. Total Site Use MP Material is a **site count**, not a stock quantity. There is **no** list of site names (no Kongowe_South chips).

6. T3 — Receive material (not “stock provided”)

Receive means material arrived for **this work order**. The dashboard card **Total Work Orders Receive Material** counts **sites** that had a work order raised and then received material — it does not count warehouse pieces.

- Open SWO A → menu **Material** → **Receive Material**. A new SNWO Material Transaction opens with type Receive, original = SWO A.
- Add the item and qty (example: same part as requested, qty 2). Posting Date = today. Save and **Submit**.
- Return to SWO A and reload. Qty Received = 2. Qty Warehouse Remaining = 2. Process Status = **Material Received**.
- Open ServiceNow Dashboard, This Month. **Total Work Orders Receive Material** is a site count and should include this site (not 140 pcs of stock).

Expected: Stock Balance of Main Warehouse does **not** change on a normal Receive. Receive is SWO lifecycle, not an MP warehouse deduction.

Fail if: The dashboard still shows a large piece count (e.g. 140) for this card, or Stock Balance dropped.

7. T4 — Issue from received quantity

- On SWO A → **Material** → **Issue Material**. Type Issue. Issued To = SWO A (same). Is MP Stock = 0. Is Interchange = 0.
- Issue qty 1 of the received item. Submit.
- Reload SWO A. Qty Issued = 1. Qty Warehouse Remaining = 1 (received 2 minus issued 1). Qty Remaining (on site) = 1.
- Try a second Issue of qty 5. It must **throw**: cannot issue more than warehouse remaining.

Expected: Over-issue is blocked. Main Warehouse Stock Balance still unchanged (this was not MP stock).

8. T5 — Interchange to another work order

Interchange uses remaining **received** stock of the original SWO and issues it to a different SWO. The original request stays. A reason is mandatory.

- Create or import **SWO B** on the same or another site. Write SWO B = _____
- On SWO A → Issue Material. Set Issued To Work Order = **SWO B**. Enter Reason for Interchange. Qty 1 (the last warehouse remaining).
- On save, type becomes Interchange and Is Interchange = 1. Submit.
- Reload SWO A: Interchange Count ≥ 1, Qty Interchanged Out = 1, Warehouse Remaining = 0.
- Reload SWO B: Qty Issued includes 1, Qty Interchanged In = 1. Original Work Order on the transaction is still SWO A.

Expected: You cannot interchange without a reason. SWO A is not deleted or overwritten.

9. T6 — Issue MP stock (company warehouse)

MP Issue is the only ServiceNow step that must reduce ERPNext Stock Balance. Use an item that has qty in Main Warehouse.

- Note Stock Balance for the MP item in Main Warehouse: before = _____
- On SWO A (or SWO B) → **Material** → **Issue MP Stock**. Type MP Issue, Is MP Stock = 1, Warehouse = Main Warehouse.
- Add item and qty 1. Submit. A Stock Entry is created and linked on the transaction.
- Stock Balance after = _____ (must be before minus 1).
- Reload the SWO. Qty MP Issued ≥ 1. **MP Material Used** = 1. If an old MP issue has no Stock Entry, use **Deduct MP Stock**.
- Dashboard → Total Site Use MP Material = count of distinct sites that used MP in the period (not piece qty).

Fail if: Stock Balance unchanged after a submitted MP Issue, or dashboard shows piece qty 15 instead of a site count.

10. T7 — Consume on site

- On the SWO that received the issue (A or B) → **Material** → **Consume Material**.
- Consume qty 1 of an item that has Qty Remaining. Submit.
- Reload: Qty Consumed increased, Qty Remaining decreased. Process Status = Material Consumed (unless already further).
- Try to consume more than remaining. It must throw.

Expected: Consume never deducts Main Warehouse again. It only reduces issued-on-site remaining.

11. T8 — Reconcile and complete

- Optional: Material → Reconcile, add a line, submit. Process Status = Reconciliation.
- Material → Complete Work Order → confirm. Process Status = Completed.
- Complete also posts any submitted MP issues that still lack a Stock Entry.

12. T9 — Reports

Report	How to open	What to check
SNWO Material Traceability	Search the report, or Dashboard tab Materials / Reports	Full summary for the SWO: requested, received, issued, consumed, remaining, MP issued, warehouse remaining. This is the main summary report.
SNWO MP Material Report	Dashboard tab MP Material	MP rows appear. Warehouse Remaining is real Bin / warehouse qty, not 0.
SNWO Interchange Report	Dashboard tab Interchange	The T5 interchange is listed with original SWO, issued-to SWO, qty, reason.
Excel export	On any report use ■ → Export, or Dashboard Export Report	File opens with the same figures. Full data export is acceptable.

- Filter Traceability to SWO A. Figures match the form.
- Filter MP report to the MP item. Warehouse Remaining equals Stock Balance / Bin, not 0.
- Interchange report contains SWO A → SWO B.

13. T10 — Dashboard acceptance

Card / control	Meaning	Check
Total Work Orders	SWOs created in the date range	Includes SWO A (and B if created in range)
Total Work Orders Receive Material	Count of **sites** with a SWO raised and material received — not stock pcs	Increases after T3. Not a warehouse quantity
Completed Work Orders	Completed or Closed in range	Increases after T8 if completed in range
On Progress Work Orders	Not completed	Moves when you complete
Total Site Use MP Material	Count of **sites** that used MP stock in the range	Increases after T6. No site-name list under the cards
Total Site Material Not Issued	Warehouse remaining on SWO materials (pcs)	Falls after issues from received stock
Total Site Material Returned	Returned qty (pcs)	0 unless returns exist
Site Interchange chart	Interchange qty over time	T5 appears in the week/day bucket
Consumed vs Remain chart	Consume vs remaining	Moves after T7

Card / control	Meaning	Check
This Month / dates / Export	Filter and Excel	Export downloads ServiceNow-Dashboard-*.xlsx

14. Quick click path (cheat sheet)

Desk search → **ServiceNow Site Work Order** → open SWO → **Material** menu: Receive Material → Issue Material → Issue MP Stock → Consume Material → Reconcile → Complete Work Order.

Desk search → **servicenow dashboard** → /app/snwo-overview → tabs Work Orders, Materials, Interchange, MP Material, Reports.

If /app/servicenow-dashboard is blank, it should redirect to /app/snwo-overview. If Docker port 8095 is blocked, run **net stop winnat** then **net start winnat** in Admin PowerShell, or publish another host port.

15. Sign-off

Role	Name	Date	T0–T10 result	Notes
Tester			Pass / Fail	
Warehouse lead			Pass / Fail	
System owner			Pass / Fail	

End of ServiceNow test guide. Do not treat a passing HTT scenario as a passing ServiceNow scenario.
